Ejector

Gas(Air) ejector is operated with gases or compressor. The operating principles of a Gas(Air) ejector is that the pressure energy in the motive gas(air) is converted into velocity energy in the nozzle, and this high velocity jet of gas(air) entrains the vapor of gas being pumped.

※ Especially, Air ejector is installed at suction side of watering vacuum pump, it can prevent cavitation of vacuum pump at max. vacuum deg. and produce max. vacuum deg. up to 20 Torr.

INSTALLATION FOR VACUUM PUMP

AIR EJECTOR

Steam under pressure discharge at high velocity through a nozzle and entrains the suction liquid or slurry.

BOOSTER PUMPS

Booster Pumps

WSBP Series

Features

- No mechanical friction and noise, which to avoid the high-frequency transmission of power
- Compared with the rigid coupling, Magnetic drive is low noise, crash, and start running smoothly
- Magnetic drive can effectively protect the motor from electrical overload when Booster pump starting
- The sealing structure in inner structure keeps little distance with outer magnet, so it can protect the pump from friction and lubricant contamination, that the pump will works long-term without any leakage
- The structure without oil seal will not affect the ultimate pressure. The pump does not require lubrication, which can clean up the environment.

DIFFUSION PUMPS

Diffusion Pumps

WSD Series

Structure & Working Principle

- Oil Steam ejected toward lower direction and gas molecule are captured in the jet vapour stream and then discharging out after condensation.
- It consists of pump body, diffusion pump oil, boiler heater and jet stack assembly. The water cooling pipe winds around the pump body in order to put condensed vaporize steam back to the liquids
- Install outlet for the purpose of discharging out condensed gas molecules from lower wall of pump body to the backing pump
- Pump body usually has jar and cylinder types and are stainless steel material mostly. Attain to a higher vacuum is to install a cold trap at inlet side.
